## The Cell Cycle - Mitosis

**Stages of the Cell Cycle (I - PMAT - C)**

**Interphase**  
Interphase has three parts - G<sub>1</sub>, S, and G<sub>2</sub>. The cell grows during G<sub>1</sub>, replicates DNA during S, and prepares for division during G<sub>2</sub>.

**Prophase**  
Chromatin condenses into visible chromosomes (represented as nuclear membrane dissolves, centrioles move to opposite sides, spindle fibers begin to form).

**Metaphase**  
Chromosomes line up along the cell. Each chromosome sister chromatids separate to chromosomes.

**Anaphase**  
Sister chromatids are pulled apart. The pieces are moved to opposite sides of the cell and recombine.

**Telophase**  
The chromosomes move into chromatin, & nuclear membrane reforms around the two sets of chromosomes.

**Section 6.2 - The Cell Cycle and Mitosis**

**Cell Growth**

Most cells are very small, between 1-100 µm in diameter. (For comparison, a strand of human hair is 70 µm in width.) Cells are small because they are limited by their surface area to volume ratio. As a cell grows, its volume increases faster than its surface area, and it begins to have difficulty transporting nutrients and waste. By remaining small, cells can manage a more efficient internal transport and communication system that means that when a cell reaches its size limit, it must either stop growing or divide. The process of growing and dividing is known as the cell cycle.

Epithelial cells, which cover the vegetation, and muscle fibers, which make up the body's skeletal and binary tissues, during binary division, produce daughter cells with the same results as mitosis.

1. Explain what happens in each of the stages.

2. How does mitosis help a multicellular organism grow? How does mitosis help a unicellular organism grow? How does mitosis help a cell grow after a wound?

3. Compare the cell cycle of a unicellular organism to that of a multicellular organism.

Morton Bradbury, Norman Maclean, Harry Roy Matthews, 1981 *Eukaryotic Gene Expression* Ajit Kumar, 2013-03-09 The recent surge of interest in recombinant DNA research is understandable considering that biologists from all disciplines using recently developed molecular techniques can now study with great precision the structure and regulation of specific genes As a discipline molecular biology is no longer a mere subspecialty of biology or biochemistry it is the new biology Current approaches to the outstanding problems in virtually all the traditional disciplines in biology are now being explored using the recombinant DNA technology In this atmosphere of rapid progress the role of information exchange and swift publication becomes quite crucial Consequently there has been an equally rapid proliferation of symposia volumes and review articles apart from the explosion in popular science magazines and news media which are always ready to simplify and sensationalize the implications of recent discoveries often before the scientific community has had the opportunity to fully scrutinize the developments Since many of the recent findings in this field have practical implications quite often the symposia in molecular biology are sponsored by private industry and are of specialized interest and in any case quite expensive for students to participate in Given that George Washington University is a teaching institution our aim in sponsoring these Annual Spring Symposia is to provide at cost a forum for students and experts to discuss the latest developments in selected areas of great significance in biology Additionally since the University is located in Washington D C

**Holt Biology Chapter 24 Resource File: Plant Reproduction** Holt Rinehart & Winston, Holt, Rinehart and Winston Staff, 2004 *Proteins and Steroids in Early Pregnancy* H.M. Beier, P. Karlson, 2012-12-06 It is about 15 years since the first presentation on uteroglobin was given to a group of developmental biologists reproductive physiologists and geneticists who had gathered in November 1966 at Konstanz Germany In the following decade so much knowledge was accumulated that a special symposium seemed appropriate This was organized as a satellite symposium to the International Congress of Endocrinology at Hamburg and brought together 50 scientists at Aachen These scientists working in the field of proteins and steroids in early pregnancy recognized the impact of what had been reported and many of them later agreed to contribute to

this book and thus to present their research data available until December 1980 The present volume covers a relatively broad spectrum of data and observations which shed some light on preimplantational embryonic life and on the supports and obstacles provided by the maternal organism with respect to final accomplishment of normal implantation and establishment of pregnancy The book will serve both as a textbook and as a scientific dictionary for Ph D students postdoctoral fellows and advanced scientists working in this area The course of early pregnancy depends very much on a proper balance of steroid hormones and the induction of protein synthesis by steroid hormones is one of the well known fundamental processes in cellular differentiation and embryonic development
