Biostatistical Methods John M. Lachin, 2009-09-25 Comprehensive coverage of classical and modern methods of biostatistics *Biostatistical Methods* focuses on the assessment of risks and relative risks on the basis of clinical investigations It develops basic concepts and derives biostatistical methods through both the application of classical mathematical statistical tools and more modern likelihood based theories The first half of the book presents methods for the analysis of single and multiple 2x2 tables for cross sectional prospective and retrospective case control sampling with and without matching using fixed and two stage random effects models The text then moves on to present a more modern likelihood or model based approach which includes unconditional and conditional logistic regression the analysis of count data and the Poisson regression model and the analysis of event time data including the proportional hazards and multiplicative intensity models The book contains a technical appendix that presents the core mathematical statistical theory used for the development of classical and modern statistical methods

Biostatistical Methods The Assessment of Relative Risks Presents modern biostatistical methods that are generalizations of the classical methods discussed Emphasizes derivations not just cookbook methods Provides copious reference citations for further reading Includes extensive problem sets Employs case studies to illustrate application of methods Illustrates all methods using the Statistical Analysis System r SAS Supplemented with numerous graphs charts and tables as well as a Web site for larger data sets and exercises

Biostatistical Methods The Assessment of Relative Risks is an excellent guide for graduate level students in biostatistics and an invaluable reference for biostatisticians applied
