

MONONOMIALS, POLYNOMIALS AND FACTORING

Polynomials

A **polynomial** consists of two or more terms. For example, $x + y$, $y^2 - x^2$, and $x^2 + 3x + 5y^2$ are all polynomials. A **binomial** is a polynomial that consists of exactly two terms. For example, $x + y$ is a binomial. A **trinomial** is a polynomial that consists of exactly three terms. For example, $y^2 + 9y + 8$ is a trinomial.

Polynomials usually are arranged in one of two ways. **Ascending order** is basically when the power of a term increases for each succeeding term. For example, $x + x^2 + x^3$ or $5x + 2x^2 - 3x^3 + x^5$ are arranged in ascending order. **Descending order** is basically when the power of a term decreases for each succeeding term. For example, $x^3 + x^2 + x$ or $2x^5 + 3x^2 + 7x$ are arranged in descending order. Descending order is more commonly used.

Adding and subtracting polynomials

To *add or subtract polynomials*, just arrange *like terms* in columns and then add or subtract. (Or simply add or subtract like terms when rearrangement is not necessary.)

Example 1

Do the indicated arithmetic.

1. Add the polynomials.

$$\begin{array}{r} a^2 + ab + b^2 \\ 3a^2 + 4ab - 2b^2 \\ \hline 4a^2 + 5ab - b^2 \end{array}$$

Computer Algebra Methods for Equivariant Dynamical Systems Karin Gatermann, 2007-05-06 This book starts with an overview of the research of Gröbner bases which have many applications in various areas of mathematics since they are a general tool for the investigation of polynomial systems The next chapter describes algorithms in invariant theory including many examples and time tables These techniques are applied in the chapters on symmetric bifurcation theory and equivariant dynamics This combination of different areas of mathematics will be interesting to researchers in computational algebra and or dynamics

Mathematical Investigations Phil DeMarois, Mercedes A. McGowen, Darlene Whitkanack, 2001 Reflective of AMATYC and NCTM standards for teaching mathematics this text the first in a series of two texts aims to make mathematics truly accessible to all students by taking an active approach to learning Focused on mathematical reasoning and problem solving strategies *Mathematical Investigations* presents a series of carefully sequenced investigations where students gather data and work collaboratively to discover key concepts The function concept is central to all topics from Chapter 3 forward and is explored through multiple representations This text explores variables notation and processes explicitly rather than assuming students have mastered these concepts in previous courses Content is explored in depth and contextual problems are revisited throughout the text to create a spiral that gives students multiple opportunities to master important skills and concepts Graphing calculators are integrated throughout the text to help students discover patterns and interpret data intelligently Students construct their knowledge of a particular topic in a real world context and then reinforce this knowledge through reflection practice and synthesis with other topics as they work through the text

This plan TASP includes testing entering freshmen on fundamental skills necessary for success in a college curriculum. The purpose of the chapter review is to give students a sample test allowing them to determine areas they need to concentrate on before an exam. The review problems at the end of each section were designed to reinforce material learned in previous sections. The applied problems account for over 10% of the 1400 problems in this book. Basic knowledge of arithmetic is the only prerequisite for this book. Some background concepts from arithmetic are reviewed in Chapter 1. Algebra concepts are explained with many examples and exercises. This book is appropriate for students who have never studied algebra, students who have had trouble with algebra in the past, and returning students who have not studied mathematics for a number of years.
