

Algebra Chapter 4

Linear equations and matrices

Solution of linear equations

We all know how to solve two linear equations in two unknowns, such as, for example,

$$2x + 3y = 3$$

$$3x + 4y = 5.$$

The aim is to eliminate x from one equation and y from the other, so that we end up with the solution

$$x = 3$$

$$y = -1.$$

Note that the solution can be thought of as two other equations, namely

$$1x + 0y = 3$$

$$0x + 1y = -1.$$

These solution equations are of a particularly simple form, in that each equation has one coefficient equal to 1 and the other coefficient(s) equal to 0. The process usually called eliminating a variable can be looked at as changing the coefficient of that variable to zero, and the general solution process can be regarded as modifying the coefficients of the given equations in such a way that we end up with new equations, in each of which one coefficient is 1 and all other coefficients are 0.

In this solution process the following operations are used:

- (1) multiply an equation through by a non-zero constant,
- (2) add or subtract a multiple of one equation to or from another one.

These operations are legitimate, provided they are applied to both sides of the equations, since they simply represent the facts:
