Proceedings of the 9th Workshop on Aspects, Components, and Patterns for Infrastructure Software (ACP4IS '10) Bram Adams, Michael Haupt, Daniel Lohmann, 2010 Aspect oriented programming component models and design patterns are modern and actively evolving techniques for improving the modularization of complex software In particular these techniques hold great promise for the development of systems infrastructure software e g application servers middleware virtual machines compilers operating systems and other software that provides general services for higher level applications The developers of infrastructure software are faced with increasing demands from application programmers needing higher level support for application development Meeting these demands requires careful use of software modularization techniques since infrastructural concerns are notoriously hard to modularize Aspects components and patterns provide very different means to deal with infrastructure software but despite their differences they have much in common For instance component models try to free the developer from the need to deal directly with services like security or transactions These are primary examples of crosscutting concerns and modularizing such concerns are the main target of aspect oriented languages Similarly design patterns like Visitor and Interceptor facilitate the clean modularization of otherwise tangled concerns Building on the ACP4IS meetings at AOSD 2002 2009 this workshop aims to provide a highly interactive forum for researchers and developers to discuss the application of and relationships between aspects components and patterns within modern infrastructure software The goal is to put aspects components and patterns into a common reference frame and to build connections between the software engineering and systems communities

**Surreptitious Software** Jasvir Nagra, Christian Collberg, 2009-07-24 This book gives thorough scholarly coverage of an area of growing importance in computer security and is a must have for every researcher student and practicing professional in software protection Mikhail Atallah Distinguished Professor of Computer Science at Purdue University Theory Techniques and Tools for Fighting Software Piracy Tampering and Malicious Reverse Engineering The last decade has seen

significant progress in the development of techniques for resisting software piracy and tampering. These techniques are indispensable for software developers seeking to protect vital intellectual property. *Surreptitious Software* is the first authoritative comprehensive resource for researchers, developers, and students who want to understand these approaches, the level of security they afford, and the performance penalty they incur. Christian Collberg and Jasvir Nagra bring together techniques drawn from related areas of computer science, including cryptography, steganography, watermarking, software metrics, reverse engineering, and compiler optimization. Using extensive sample code, they show readers how to implement protection schemes ranging from code obfuscation and software fingerprinting to tamperproofing and birthmarking and discuss the theoretical and practical limitations of these techniques. Coverage includes: Mastering techniques that both attackers and defenders use to analyze programs; Using code obfuscation to make software harder to analyze and understand; Fingerprinting software to identify its author and to trace software pirates; Tamperproofing software using guards that detect and respond to illegal modifications of code and data; Strengthening content protection through dynamic watermarking and dynamic obfuscation; Detecting code theft via software similarity analysis and birthmarking algorithms; Using hardware techniques to defend software and media against piracy and tampering; Detecting software tampering in distributed systems; Understanding the theoretical limits of code obfuscation.
