

Geometry of Circles

Students who successfully complete this primer will be able to:

- Calculate the area and circumference of a circle.
- Apply the relationship between the radius of a circle and an arc length.

Radius, radians, and arc length

In many physics applications, it is necessary to connect between the distance from the center of a circle, the radius r , and the distance along the circumference, called the arc length s . These two parameters are related by the angle θ swept out from the starting point of the arc, typically defined as the x -axis, and the end point $(\cos\theta, \sin\theta)$.

Scientists and mathematicians typically measure the angle θ in radians rather than degrees, which is defined as:

$$1 \text{ (radian)} = \left\{ \frac{1}{r} \right\} r = r^{-1}$$

The second formula is another way to write the definition of circumference with s being an arc that contains an entire circle and r being the radius of the circle. That means that 2π must be the angle of the entire circle:

$$2\pi \text{ (radians)} = 2\pi \text{ (radius)} = 2\pi r$$

In fact, the radius of a circle can be thought of as a conversion factor between the angular position θ and the arc length s :

$$1 \text{ (radius)} = 1 \text{ (radius)} \left(\frac{2\pi \text{ (radius)}}{2\pi \text{ (radians)}} \right) = 2\pi r$$
