Energy

Energy stores and systems

- First, choose the start and end dates; second, find the energy stores at those points; third, show which stores empty and which stores fill up.
- Electrical working
 - Heating of particles
 - Mechanical working
 - Heating of particles
- Example 1: A weightlifter lifting a weight transfers energy via mechanical working.
Example 2: A phone transfers energy via heating by radiation.

Changes in energy stores

- 307 J
- 1173 J
- Cyclist A's E_k is 9 times higher than the E_k for cyclist B. This is because their speed is 3 times that of cyclist B, and $2^3 = 9$.

Energy changes in systems – specific heat capacity

- 44 500 J
- The thermal store will increase by 4700 J as energy is conserved.
- 0

Power

- 30 000 W, because it transfers more energy per second to the water.
- 11 J
- 5600 J

Energy transfers in a system

- Wear uncoiled helmet and adjust body position to reduce air resistance; lubrication between pedals chain and gears to reduce heating effects of friction; High pressure in tyres to reduce surface area of contact between the road and the tyre.
- The infrared radiates from the heating elements in the heater warms the surrounding air which rises so not all the energy is transferred through heating by radiation to the food.
- Less fuel consumption; Tyres, brakes and other components do not get worn out as quickly.

Efficiency

- Because in any change within a system some energy is dissipated to the surroundings.
- Because the useful energy transferred to the numerator of the fraction and the input energy is the denominator, since the useful energy transferred can never be greater than the input energy, the fraction can never return a value greater than 1.
- Being only 25% efficient means that our body needs to take in 4 times more energy from the chemical store to do the mechanical work needed during exercise, e.g. to lift a weight.

National and global energy resources

- Renewable energy resources can be replaced; non-renewable but non-conventional energy resources cannot be replaced and so will eventually run out if we keep using them.
- Fossil fuels have high power output and are very reliable.
- Accept any of the following: Larger areas are needed to harvest it; there is low power output; it has a low conversion efficiency; it can only be harvested during daylight hours.

Review 10

- Renewable: wind waves, tides, hydroelectricity, the Sun, geothermal, the tides.
Non-renewable: nuclear fuels, coal, oil, natural gas.
- kinetic energy = 0.5 × mass × (speed)²
 $E_k = \frac{1}{2} \times 0.1 \times 10^2 = 0.5 \text{ J}$
 - elastic potential energy = 0.5 × spring constant × (extension)²
 $E_e = \frac{1}{2} \times 40 \times 0.1^2 = 0.2 \text{ J}$
 - grav. potential energy = mass × gravitational field strength × height
 $E_g = m \times g \times h = 0.1 \times 10 = 1 \text{ J}$
- ΔE is a compound difference, and degree Celsius and kelvin have the same magnitude, so using either degree Celsius or kelvin will affect the total of the calculator. Because the starting difference gives the same result. For example, the

temperature increase between 2°C and 20°C is $\Delta\theta = 20 - 2 = 18^\circ\text{C}$, which expressed in kelvin would be $\Delta\theta = 200.15 - 273.15 = 18 \text{ K}$.

- 1.0 J has given power loss 50 W, because it uses 50 J to come back the same height in less time. Because of energy transferred it might be for 50 W.
 - Energy transferred is $E_p = mgh$ and $P = \frac{E}{t} = \frac{500}{1}$
 $h = \frac{E}{mg} = \frac{20 \times 10}{20 \times 10} = 2.0 \text{ m}$

So, each floor is $\frac{4.0}{2} = 2.0 \text{ m}$ high.

- Aluminium has a higher thermal conductivity than plastic, so it will transfer energy by conduction to the ice cube at a higher rate than the plastic block, so the ice cube on the aluminium block will melt faster than the cube on the plastic block.
- First we need to calculate the energy in the kinetic store when the car is at top speed.

$$E_k = \frac{1}{2}mv^2 = \frac{1}{2} \times 0.800 \times 0.2^2 = 0.016 \text{ J}$$

So, at top speed the toy car transfers 0.016 J to the kinetic store each second. This means a useful power output of 0.016 W. So, to find the efficiency of the toy car:

$$\begin{aligned} \text{Efficiency} &= \frac{\text{Useful power output}}{\text{Total power input}} \\ &= \frac{0.016}{0.032} = 0.50 \end{aligned}$$

We can multiply by 100 to find the percentage efficiency, i.e. 50%.

Electricity

Standard circuit diagram symbols

- Ammeters have fairly big resistance, but voltmeters have very high resistance.
- Their I-V characteristics are very similar and they both let current flow only in one direction. However, LEDs emit light, while diodes do not.
- A diode in series with an LED.

Electrical charge and current

- An electrical circuit is the flow of electrical charge.
- Free electrons fill all the components of the circuit all the time, even when the circuit is open, so, when the circuit is closed all the free electrons will start drifting
