

# Enzymes

There are thousands of different chemical reactions going on inside living organisms all the time. Enzymes are large proteins that play an important role in speeding up these chemical reactions.

A reaction can usually be made to happen more quickly by raising the temperature. This would speed up the useful reactions as well as the unwanted ones. There's also a limit as to how high the temperature can be raised inside a living organism before its cells start to become damaged.

Enzymes speed up the useful chemical reactions without the need for high temperatures. Enzymes are produced by living organisms to act as **biological catalysts**.

A catalyst is a substance that increases the speed of a reaction, without being used up or changed in the reaction.

## How Enzymes Work

Every enzyme has an active site with a unique shape that fits onto the **substrate** (the substance that an enzyme acts on). For an enzyme to work, the substrate has to fit into its active site. If the substrate doesn't match the active site, then the reaction won't be catalysed.

Enzymes usually only catalyse one specific reaction. An enzyme will only bind to one specific substrate.
