

## Unit: Cellular Respiration Lab

### Introduction:

Cellular respiration converts chemical energy stored in food to ATP. This energy is used to power various cellular processes. The rate of cellular respiration can be measured by the amount of oxygen consumed or the amount of carbon dioxide produced. In this lab, you will use a respirometer to measure the rate of cellular respiration in germinating seeds. The respirometer consists of a chamber containing the seeds, a chamber containing a gas, and a chamber containing a liquid. The gas chamber is connected to the liquid chamber by a tube. As the seeds respire, they consume oxygen and produce carbon dioxide. The carbon dioxide is absorbed by a substance in the liquid chamber, causing the liquid to move. The distance the liquid moves is proportional to the amount of oxygen consumed.
