Synthesizing Synchronous Systems by Static Scheduling in Space-Time Björn Lisper, 1989-05-10 The subject of this book is the synthesis of synchronous hardware The purpose is to provide a firm mathematical foundation for the so called space time mapping methods for hardware synthesis that have been proposed during the last few years Thus the treatment is fairly mathematical In a space time mapping method an algorithm is described as a set of atomic events with possible data dependencies between them The task is to find a mapping assigning a space time coordinate to each event so that causality is not violated and the solution is good Previous work in the area if it provided any formalism at all has relied mainly on uniform recurrence equations extensions thereof or on purely graph theoretic formulations In this project algebra is used instead and the close connection with single assignment languages is stressed Thus it is possible to generalize previous work and to give simple characterizations of the type of algorithms that can be implemented with space time mappings The results presented
