Structural Embeddings: Mechanization with Method César A. Muñoz,Institute for Computer Applications in Science and Engineering. (ICASE),1999 Abstract The most powerful tools for analysis of formal specifications are general purpose theorem provers and model checkers but these tools provide scant methodological support Conversely those approaches that do provide a well developed method generally have less powerful automation It is natural therefore to try to combine the

better developed methods with the more powerful general purpose tools An obstacle is that the methods and the tools often employ very different logics We argue that methods are separable from their logics and are largely concerned with the structure and organization of specifications We propose a technique called structural embedding that allows the structural elements of a method to be supported by a general purpose tool while substituting the logic of the tool for that of the method We have found this technique quite effective and we provide some examples of its application We also suggest how general purpose systems could be restructured to support this activity better
