Environmental Hydraulics. Volume 1 Georgos C. Christodoulou, Anastasios I. Stamou, 2022-03-07 Over the last two decades environmental hydraulics as an academic discipline has expanded considerably caused by growing concerns over water environmental issues associated with pollution and water balance problems on regional and global scale These issues require a thorough understanding of processes related to environmental flows and transport phenomena and the development of new approaches for practical solutions Environmental Hydraulics includes about 200 contributions from 35 countries presented at the 6th International Symposium on Environmental Hydraulics Athens Greece 23-25 June 2010 They cover the state of the art on a broad range of topics including fundamentals aspects of environmental fluid mechanics environmental hydraulics problems of inland coastal and ground waters interfacial processes computational experimental and field measurement techniques ecological aspects and effects of global climate change Environmental Hydraulics will be of interest to researchers civil environmental engineers and professional engineers dealing with the design and operation of environmental hydraulic works such as wastewater treatment and disposal river and marine constructions and to academics and graduate students in related fields

Biological Flow Modelling Suvash C. Saha, Akshoy Ranjan Paul, 2025-10-28 The book on Biological Flow Modelling is a pioneering exploration at the intersection of biomedical engineering and computational fluid dynamics It masterfully investigates into the complexities of bio fluid phenomena from intricate airway structures and cardiovascular biomechanics to advanced drug delivery systems and neurological fluid dynamics By integrating cutting edge simulations and clinical insights it not only advances our understanding of physiological and pathological processes but also paves the way for innovative healthcare solutions This comprehensive anthology showcases authors collective expertise and vision offering readers a profound perspective on the dynamic interplay between fluids and biological systems

Numerical and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment Umer Afzal, 2017 There are many sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without

emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts
