

THE MAIN MUSCLES OF THE FACE

OCCIPITOFRONTALIS

This muscle elevates the eyebrow & skin of the forehead, producing an expression of shock or surprise, as well as frown the eyebrow by pulling the scalp forward & wrinkling the forehead. Since the muscle heads of the frontal belly are separated, it is possible to perform these movements on only one of the halves of the face.

PROFRONSUS

A small pyramidal muscle from the nasal base & superior part of the lateral nasal cartilage. Its superior attachment depresses the eyebrow's medial ends & wrinkles the skin over the glabella. It creates frowning when exposed to bright light or other eye irritants. It also conveys expression of anger or sorrow.

CORONATOR SUPERCILII

A slender muscle found in the medial end of the eyebrow, arising from the medial end of the superciliary arch of the frontal bone & extend laterally & slightly superiorly to the middle part of the eyebrow. Upon contraction, it pulls the eyebrow medially & produce vertical wrinkles over the glabella, creating a facial expression of frowning.

LEVATOR LABII SUPERIORIS

Together with zygomaticus minor & levator labii superioris alaeque nasi, this short muscle is a direct motor of the upper lip. By contracting, it helps other buccolabial muscles to elevate & invert the upper lip. This action exposes the maxillary teeth & deepens the nasolabial furrow, which can express smiling, smugness & contempt.

TEMPORALIS

The contraction of the posterior fibers results in the backward movement of the mandible (retrusion). The contraction of its anterior fibers moves the mandible downwardly (elevation). In union, these actions facilitate the closing of the mouth and the compression of the teeth. Additionally, the unilateral contraction plays an important role in moving the jaw side-to-side.

NASALIS

A small muscle on each side of the dorsum of the nose. It compresses the nasal aperture with its transverse part (the area over the dorsum of the nose) & dilates the nostrils with its alar part (the area of the nostrils). This action creates facial expressions such as conveying feelings of anger, but also to enhance deep-breathing.

ORBICULARIS OCULI

A sphincter-like muscle encircling the orbit & the periorbital area. The contractor of the orbital part (the most peripheral part overlying the orbital rim) pulls the skin of the eyelid & cheek towards the nose & slightly closes the eyes. In turn, the palpebral part (the central part of the muscle that comprise eyelids) exhibit a finer control of the eyelids by closing them gently during blinking or sleeping. Finally, the palpebral part (the deepest part of the orbicularis oculi situated between the medial palpebral ligament & the lacrimal sac) pulls the eyelids & lacrimal papillae medially & dilates the lacrimal sac while compressing the lacrimal gland & ducts. These actions facilitate the flow of tears across the lacrimal apparatus.

PLATYSMA

The actions of the platysma muscle include pulling down the mandible, which opens the mouth, & pulling the corners of the lips out to the side and down, which forms a frown. Additionally, the platysma muscle can form wrinkles in the neck as a person ages & their skin becomes less elastic & starts to sag.

ORBICULARIS ORIS

Bilateral contraction bring the lips together & close the mouth. This action is important for mastication, as it cooperates with the buccinator muscle & the tongue to prevent food from escaping the teeth or accumulate in the oral vestibule during eating. Isolated contraction produces movements such as lip pouting, twisting, pursing & others, greatly contributing to facial expressions & speech. Marginal portions (also referred to as the labial cords as by changing their length & tension similar to the vocal cord) produce some consonantal (labiod) sounds & act as vibrating strings & enable whistling or playing a wind instrument.

DEPRESSOR LABII INFERIORIS

A short quadrangular muscle in the chin region that originates from the oblique line of the mandible while being continuous with the labial part of the platysma. It is the main tractor of the lower lip, responsible for pulling the lower lip inferomedially along with the labial part of the platysma.

MENTALIS

A short conical muscle. Depresses & evert the base of the lower lip, while also creating wrinkles on the skin of the chin. These actions shape the lips while drinking, as well as create expressions to convey sadness, contempt & doubt.

ZYGMATICUS MINOR

Inserts on the skin of the upper lip & acts in harmony with other upper lip tractors to elevate & evert, contributing to a variety of facial expressions such as smiling, frowning or grimacing.

ZYGMATICUS MAJOR

Arises from the lateral surface of the zygomatic bone & extends diagonally to the angle of the mouth. It elevates & everts the angle of the mouth superiorly, producing a smile in synergy with other muscles.

BUCCINATOR

Filling the space between the maxilla & mandible, it compresses the cheeks against the molar teeth & forestalls biting the cheek during mastication. Also keeps food centered in the oral cavity & limit its looking into the oral vestibule. In addition, has a role in playing wind instruments or whistling.

MASSETER

Elevates the mandible causing a powerful jaw closure. Contraction of the superior part move the mandible forward (protrusion). Furthermore, the muscle stabilizes the tension of the articular capsule of the temporomandibular joint.

LEVATOR LABII SUPERIORIS ALAEQUE NASI

A slim muscle on both sides of the nose. It elevates the lip, flares the nostril, & deepens & increase the curvature of the nasolabial furrow.

RISORIIUS

Deemed the "smiling muscle" since its main function involve pulling the angles of the mouth laterally & superiorly to produce a smile.

DEPRESSOR ANGULI ORIS

Situated lateral to the chin. It depresses the mouth angle, contributing to expressing sadness or anger. In addition, assists mouth to open during speaking or eating.
