

Mathematik für Informatiker I, Kapitel 12

**Aufgabe 12.1.** Gegeben sei die Funktion  $f: \mathbb{R} \rightarrow \mathbb{R}$ ,  $f(x) = x^2 + 2x + 1$ . Zeigen Sie, dass  $f$  ein Polynom ist, das die Gleichung  $f(x) = (x+1)^2$  erfüllt. (Hinweis: Verwenden Sie die Binomische Formel.)

$$f(x) = x^2 + 2x + 1 = (x+1)^2$$

**Lösung:** Die Binomische Formel lautet für  $a, b \in \mathbb{R}$ :

Es gilt  $(a+b)^2 = a^2 + 2ab + b^2$ . Setzt man  $a = x$  und  $b = 1$  ein, so erhält man  $(x+1)^2 = x^2 + 2x + 1$ . Dies ist genau die Funktion  $f$ . Folglich gilt  $f(x) = (x+1)^2$  für alle  $x \in \mathbb{R}$ .

$$(x+1)^2 = x^2 + 2x + 1 = f(x)$$

**Aufgabe 12.2.** Gegeben sei die Funktion  $f: \mathbb{R} \rightarrow \mathbb{R}$ ,  $f(x) = x^2 + 2x + 1$ . Zeigen Sie, dass  $f$  ein Polynom ist, das die Gleichung  $f(x) = (x+1)^2$  erfüllt. (Hinweis: Verwenden Sie die Binomische Formel.)

- (a)  $f(x) = x^2 + 2x + 1$  impliziert  $f(x) = (x+1)^2$ .
- (b)  $f(x) = x^2 + 2x + 1$  impliziert  $f(x) = (x+1)^2$ .
- (c)  $f(x) = x^2 + 2x + 1$  ist äquivalent.

$$f(x) = x^2 + 2x + 1 = (x+1)^2$$

**Lösung:** Die Binomische Formel lautet für  $a, b \in \mathbb{R}$ :  $(a+b)^2 = a^2 + 2ab + b^2$ . Setzt man  $a = x$  und  $b = 1$  ein, so erhält man  $(x+1)^2 = x^2 + 2x + 1$ . Dies ist genau die Funktion  $f$ . Folglich gilt  $f(x) = (x+1)^2$  für alle  $x \in \mathbb{R}$ .

*Linear Optimization and Approximation* K. Glashoff, S.-A. Gustafson, 2012-12-06 A linear optimization problem is the task of minimizing a linear real valued function of finitely many variables subject to linear constraints in general there may be infinitely many constraints This book is devoted to such problems Their mathematical properties are investigated and algorithms for their computational solution are presented Applications are discussed in detail Linear optimization problems are encountered in many areas of applications They have therefore been subject to mathematical analysis for a long time We mention here only two classical topics from this area the so called uniform approximation of functions which was used as a mathematical tool by Chebyshev in 1853 when he set out to design a crane and the theory of systems of linear inequalities which has already been studied by Fourier in 1823 We will not treat the historical development of the theory of linear optimization in detail However we point out that the decisive breakthrough occurred in the middle of this century It was urged on by the need to solve complicated decision problems where the optimal deployment of military and civilian resources had to be determined The availability of electronic computers also played an important role The principal computational scheme for the solution of linear optimization problems the simplex algorithm was established by Dantzig about 1950 In addition the fundamental theorems on such problems were rapidly developed based on earlier published results on the properties of systems of linear inequalities

Computer Aided Design of Multivariable Technological Systems G. G. Leininger, 2014-05-16 Computer Aided Design of Multivariable Technological Systems covers the proceedings of the Second International Federation of Automatic Control IFAC The book reviews papers that discuss topics about the use of Computer Aided Design CAD in designing multivariable system such as theoretical issues applications and implementations The book tackles several topics relevant to the use of CAD in designing multivariable systems Topics include quasi classical approach to multivariable feedback system designs fuzzy control for multivariable systems root loci with multiple gain parameters multivariable frequency domain stability criteria and computational algorithms for pole assignment in linear multivariable systems The text will be of great use to professionals whose work involves designing and implementing multivariable systems

*Observer Design for Nonlinear Systems* Pauline Bernard, 2019-02-01 Observer Design for Nonlinear Systems deals with the design of observers for the large class of nonlinear continuous time models It contains a unified overview of a broad range of general designs including the most recent results and their proofs such as the homogeneous and nonlinear Luenberger design techniques The book starts from the observation that most observer designs consist in looking for a reversible change of coordinates transforming the

expression of the system dynamics into some specific structures called normal forms for which an observer is known. Therefore the problem of observer design is broken down into three sub problems: What are the available normal forms and their associated observers? Under which conditions can a system be transformed into one of these forms and through which transformation? How can an inverse transformation that recovers an estimate in the given initial coordinates be achieved? This organisation allows the book to structure results within a united framework highlighting the importance of the choice of the observer coordinates for nonlinear systems. In particular the first part covers state affine forms with their Luenberger or Kalman designs and triangular forms with their homogeneous high gain designs. The second part addresses the transformation into linear forms through linearization by output injection or in the context of a nonlinear Luenberger design and into triangular forms under the well known uniform and differential observability assumptions. Finally the third part presents some recently developed methods for avoiding the numerically challenging inversion of the transformation.

**Observer Design for Nonlinear Systems** addresses students and researchers looking for an introduction to or an overview of the state of the art in observer design for nonlinear continuous time dynamical systems. The book gathers the most important results focusing on a large and diffuse literature on general observer designs with global convergence and is a valuable source of information for academics and practitioners.

**Nonlinear Industrial Control Systems** Michael J. Grimble, Pawel Majecki, 2020-05-19. Nonlinear Industrial Control Systems presents a range of mostly optimisation based methods for severely nonlinear systems. It discusses feedforward and feedback control and tracking control systems design. The plant models and design algorithms are provided in a MATLAB toolbox that enable both academic examples and industrial application studies to be repeated and evaluated taking into account practical application and implementation problems. The text makes nonlinear control theory accessible to readers having only a background in linear systems and concentrates on real applications of nonlinear control. It covers different ways of modelling nonlinear systems including state space polynomial based linear parameter varying state dependent and hybrid design techniques for nonlinear optimal control including generalised minimum variance model predictive control, quadratic Gaussian factorised and H design methods. Design philosophies that are suitable for aerospace, automotive, marine process control, energy systems, robotics, servo systems and manufacturing steps in design procedures that are illustrated in design studies to define cost functions and cope with problems such as disturbance rejection, uncertainties and integral wind up and baseline non optimal control techniques such as nonlinear Smith predictors, feedback linearization, sliding mode control and nonlinear PID.

**Nonlinear Industrial Control Systems** is valuable to engineers in industry dealing with actual nonlinear systems. It provides students with a comprehensive range of techniques and examples for solving real nonlinear control design problems.

**A Course in Microeconomic Theory** David M. Kreps, 2020-05-26. David M Kreps has developed a text in microeconomics that is both challenging and user friendly. The work is designed for the first year graduate microeconomic theory course and is accessible to advanced undergraduates.

as well Placing unusual emphasis on modern noncooperative game theory it provides the student and instructor with a unified treatment of modern microeconomic theory one that stresses the behavior of the individual actor consumer or firm in various institutional settings The author has taken special pains to explore the fundamental assumptions of the theories and techniques studied pointing out both strengths and weaknesses The book begins with an exposition of the standard models of choice and the market with extra attention paid to choice under uncertainty and dynamic choice General and partial equilibrium approaches are blended so that the student sees these approaches as points along a continuum The work then turns to more modern developments Readers are introduced to noncooperative game theory and shown how to model games and determine solution concepts Models with incomplete information the folk theorem and reputation and bilateral bargaining are covered in depth Information economics is explored next A closing discussion concerns firms as organizations and gives readers a taste of transaction cost economics
