

### 3.3.7 Crossing over and random orientation promotes genetic variation

Offspring of sexual reproduction are always an *unpredictable blend* of the characteristics of the two parents – much of this randomness is due to **Meiosis**

Each gamete produced by a parent has a different combination of alleles due to two major features of Meiosis:

1. **Crossing Over:** Swapping of alleles between homologous chromosomes means infinite new combinations of alleles can be created and passed down to offspring
2. **Random Orientation of Bivalents:** Which *one* chromosome of each homologous pair that a gamete receives is random based on their orientation in Metaphase I.

*Combination Immunotherapy and Immune Response Assessment of Brain Tumours* Haihui Jiang, Henry Wang , You-Wen He, 2026-01-13 Recently significant progress has been achieved in the use of immunotherapy for hematological tumors providing new hope for patients with brain tumors Nevertheless clinical practice has demonstrated that the use of single agent immunotherapy has not produced substantial improvements in the prognosis of patients with brain tumors An increasing number of researchers are attempting combination therapies including radiotherapy chemotherapy and Tumor Treating Fields TTF treatment combined with immunotherapy to treat brain tumors Although combination therapy represents a significant breakthrough in immunotherapy for brain tumors it is still in the exploratory phase Therefore additional research is necessary to explore this field further Meanwhile treatment response assessment is another vital issue that remains to be further addressed in the clinical practice of immunotherapy of brain tumors which can contribute to providing personalized therapies for patients In this research topic we would like to identify innovative therapeutic approaches for patients with brain tumors including novel immunotherapies neoadjuvant therapy CAR cells oncolytic virotherapy and others to improve patient prognosis Additionally the potential molecular mechanism associated with tumour immunity is another critical issue requires to be explored in this

topic The identified genes can be served as treatment targets in the future Furthermore we also want to find some useful predictors and or built models to early forecast the treatment response of patients who received immunotherapies which can promote the precision medicine of brain tumors We welcome contributions from authors who are committing to improving immunotherapies in patients with brain tumors whether this be novel immunotherapies neoadjuvant therapy or combination therapy with the aim of boosting the anti tumour immune response Researches that are devoted to exploring the predictors of immunotherapy response are also needed which includes immunological scoring scales image based methods and gene expression profiles etc Contributions considered for this research topic include original articles clinical trials and review articles focusing on 1 Immunotherapies for gliomas 2 Immunotherapies for brain metastases 3 Immunotherapies for other malignancies 4 Targetable genes associated with oncoimmunology 5 Predictors of immunotherapy response Manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not accompanied by robust and relevant validation clinical cohort or biological validation in vitro or in vivo are out of scope for this topic

*Genomics and Pharmacogenomics in Anticancer Drug Development and Clinical Response* Federico Innocenti, 2008-10-30 *Genomics and Pharmacogenomics in Anticancer Drug Development and Clinical Response* provides the most comprehensive body of knowledge available on the role of genetic and genomic variation in the individualization of drug therapies in cancer patients As a consequence of the intrinsic chromosomal and genetic instability of the tumor genome it is generally believed that tailoring of chemotherapy in cancer patients might be achieved by molecular analysis of patient tumor DNA In addition to reduce the toxicity risk of patients the tumor DNA information should be integrated with the available data on polymorphic drug metabolizing enzyme and transporter genes mediating the exposure of patients to active drugs and or their active metabolites The chapters of this book clearly show how DNA information from both the host germline and the tumor should be taken into account for rational selection of drug therapies in cancer patients an aspect that received little attention despite its importance The availability of new molecular approaches to the selection of drug therapy is an emerging need because the traditional approach based on the evaluation of patient and tumor characteristics is clearly far from optimal Many treated patients do not experience significant benefits from the treatment while they often experience moderate to severe toxicities In addition the development and clinical use of novel molecularly targeted agents alone or in combination with classical cytotoxic therapy requires the understanding of the molecular features of the tumors and the identification of tumor markers of response
