

Introduction to Gas Laws – PhET Simulation

In your textbook, read section 13.1 (properties of gases) and section 14-1 (introduction to gas laws). In this simulation lab you will observe the behavior of gases when different variables are changed. The variables that we will be changing and measuring are pressure, temperature, and volume. Note: due to the 2-dimensional nature of this simulation, width will be used in place of volume.

Getting to know the system:

1. Search for the "PhET chemistry sims."
2. Open the "Gas Properties" simulation and select HTML5 option, and then "IDEAL." There are more than 1 gas simulations – take care you select the correct one!

This will give you a screen that looks like this:

The Latest and Best of TESS ,1991 Analysis of Toxic and Non-toxic Alexandrium (Dinophyceae) Species Using Ribosomal RNA Gene Sequences Christopher Alan Scholin,1993 Sequences of small subunit Ss and large subunit Ls ribosomal RNA genes rDNA from the marine dinoflagellates *Alexandrium tamarensis* *A. catenella* *A. fundyense* *A. affine* *A. minutum* *A. lusitanicum* and *A. andersoni* were compared to assess the organisms relationships Cultures represent isolates from North America Western Europe Thailand Japan Australia and the ballast water of several cargo vessels and include both toxic and non toxic strains An emphasis was placed on the *A. tamarensis* *catenella* *fundyense* species complex a group of morphotypically similar organisms found in many regions of the world Two distinct SsrRNA genes termed the A gene and the B gene were found in a toxic *A. fundyense* isolated from eastern North America The B gene is considered to be a pseudogene A restriction fragment length polymorphism RFLP assay developed to detect the A and B genes revealed five distinct groups of *Alexandrium* isolates Three subdivide the *A. tamarensis* *catenella* *fundyense* complex but do not correlate with morphospecies designations The two remaining groups are associated with cultures that clearly differ morphologically from the *A. tamarensis* *catenella* *fundyense* group the fourth group consists of *A. affine* isolates and the fifth group is represented by *A. minutum* *A. lusitanicum* and *A. andersoni* The B gene was only found in *A. tamarensis* *catenella* *fundyense* but not in all members of this species complex The B gene is not uniformly distributed among global populations of *Alexandrium* All *A. tamarensis* *catenella* *fundyense* isolates from North America harbor this gene but it has also been found in some *A. tamarensis* from scattered locations in Japan as well as in *A. tamarensis* from the ballast water of one cargo vessel which was on a defined run from Japan to Australia The B gene may be endemic to North American populations of *A. tamarensis* *catenella* *fundyense* It is possible that in the recent past North American *A. tamarensis* were introduced to Japanese waters and cysts of these organisms have been transported from Japan to Australia A subset of isolates examined using the the RFLP assay were also compared by cloning and sequencing a fragment of their LsrDNA Eight major classes of LsrDNA sequences termed ribotypes were identified Five ribotypes subdivide members of the *A. tamarensis* *catenella* *fundyense* complex all isolates containing the B gene cluster as one ribotype The three remaining ribotypes are typified by 1 *A. affine* 2 *A. minutum* and *A. lusitanicum* and 3 *A. andersoni* LsrDNAs from *A. minutum* and *A. lusitanicum* are indistinguishable *A. minutum* *lusitanicum* *andersoni* may represent another *Alexandrium* species complex analogous to the *A. tamarensis* *catenella* *fundyense* group An organisms ability to produce toxin appears to be correlated with its LsrDNA phylogenetic lineage Ribotypes ascribed by the LsrDNA sequences are in complete agreement with and offer a finer scale resolution of groups defined by SsrDNA restriction patterns The SsrDNA RFLP groups and LsrDNA ribotypes are useful species and population specific markers *Alexandrium tamarensis* *catenella* *fundyense* exist as genetically distinct strains populations not three genetically distinct species representatives collected from the same geographic region appear the most similar regardless of morphotype whereas those from

geographically separated populations are more divergent even when the same morphospecies are compared. Contrary to this general pattern, *A. tamarensis* from Japan were found to be exceptionally heterogeneous. Ballast water samples show that viable cysts resting spores of toxigenic *A. tamarensis* are being discharged into Australian ports from multiple genetically distinct source populations. The rDNA sequences were also used to test theories accounting for the evolution and global dispersal of *A. tamarensis*. Results suggest a monophyletic radiation of these organisms from a common ancestor that included or gave rise to multiple morphotypes. Populations appear to have diverged as a result of vicariance geographic isolation. The co occurrence of genetically distinct strains of these organisms is an indication of dispersal. An example of this is seen in Japan where an introduction of North American *A. tamarensis* appears likely. Determining the timing of dispersal events is problematic if based strictly on rDNA sequence similarities since these molecules undergo change on a scale of millions of years.
