

Investigating Inherited Human Traits

Heredity is the passing on of traits, or characteristics, from parent to offspring. Humans have about 20,000 genes on 23 pairs of chromosomes. Genes can range from a few hundred to 2 million bases. Most genes are the same in all people, but a small number of genes (less than 1 percent of the total) are slightly different between people. These small differences contribute to each person's unique physical features. Some genes are completely dominant or recessive while other genes may interact with one another in different ways. One way is that the phenotype of a heterozygous organism can actually be a blend of the 2 versions of the gene. (Straight + Curly = Wavy). This is known as an Incomplete Dominance.

In humans (and most other mammals), the sex of an individual is determined by the particular combination of the two sex chromosomes. Individuals that have two X chromosomes (XX) are females, whereas those with an X and a Y chromosome (XY) are males.
