

IONIC BONDS

Ionic Bonds

Reading Passage

Ionic bonds are a type of chemical bond formed due to the electrostatic attraction between oppositely charged ions. These ions are created when atoms transfer electrons, resulting in a cation (a positive ion) and a negative ion (anion). For instance, in sodium chloride (NaCl), sodium loses an electron to become a cation, while chlorine gains an electron to become an anion. The transfer of electrons creates ions that are attracted to each other because of their opposite charges.

The arrangement of ionic ions in compounds is often depicted as a crystal lattice—a highly organized, repeating three-dimensional pattern. This structure maximizes the electrostatic attractions between oppositely charged ions, which leads to characteristic physical properties such as high melting points, brittleness, and good solubility in water. The regular structure ensures that each ion is surrounded by ions of opposite charge, creating a stable configuration.

At the molecular level, the electrostatic attraction between ions leads to a stable and highly ordered structure. This stability at the atomic level contributes to the distinctive properties of ionic compounds on a macroscopic scale. For example, the high melting points of ionic compounds are due to the significant energy required to overcome the strong electrostatic forces holding ions in the lattice structure. Ionic compounds are also typically good conductors of electricity when dissolved in water, which can be used to identify and separate substances, facilitating reactions.

True or False? Ionic Bond Concepts

Circle whether each statement about ionic bonds is True or False.

1. Ionic bonds form due to the electrostatic attraction between ions with opposite charges.	10
