The water cycle, also known as the hydrologic cycle, is a continuous process that moves water around the planet. It is a natural process that is essential for life on Earth.</p> <p>Evaporation is the process by which water changes from a liquid to a gas or vapor. This process occurs when water is heated by the sun and the water molecules gain enough energy to break free from the surface of the liquid. The water then rises into the atmosphere, where it cools and condenses into clouds. This process is essential for the formation of rain and snow, which are the primary sources of fresh water on Earth.</p> <p>Condensation is the process by which water changes from a gas or vapor to a liquid. This process occurs when water vapor in the atmosphere cools and the water molecules lose energy and are forced back together. This process is essential for the formation of rain and snow, which are the primary sources of fresh water on Earth.</p> <p>Precipitation is the process by which water falls from the sky as rain or snow. This process occurs when the water molecules in the atmosphere are forced together and the water is no longer able to stay in the air. This process is essential for the formation of rain and snow, which are the primary sources of fresh water on Earth.</p> <p>Runoff is the process by which water flows over the surface of the land or into the oceans. This process occurs when the water on the ground or in the air is no longer able to stay in the air and is forced to flow. This process is essential for the formation of rivers and streams, which are the primary sources of fresh water on Earth.</p> </div> <p>Answer the questions below for each question.</p> <p>1.
