Part 3: GridWorld Classes and Interfaces

In our example program, a grid contains actors that are instances of classes that extend the `Actor` class. There are two classes that implement the `Grid` interface: `BoardedGrid` and `DefaultGrid`. Locations in a grid are represented by objects of the `Location` class. An actor knows the grid in which it is located as well as its current location in the grid. The relationships among these classes are shown in the following figure.

The Location Class

Every actor that appears has a location in the grid. The `Location` class encapsulates the coordinates for an actor's position in a grid. It also provides methods that determine relationships between locations and compass directions.

Every actor in the grid also has a direction. Directions are represented by compass directions measured in degrees: 0 degrees is north, 45 degrees is northeast, 90 degrees is east, etc. The `Location` class provides eight constants that specify the compass directions.
