Numerical Solution of Partial Differential Equations on Parallel Computers Are Magnus Bruaset, Aslak Tveito, 2006-03-05

Since the dawn of computing the quest for a better understanding of Nature has been a driving force for technological development. Groundbreaking achievements by great scientists have paved the way from the abacus to the supercomputing power of today. When trying to replicate Nature in the computer's silicon test tube there is need for precise and computable process descriptions. The scientific fields of Mathematics and Physics provide a powerful vehicle for such descriptions in terms of Partial Differential Equations (PDEs). Formulated as such equations, physical laws can become subject to computational and analytical studies. In the computational setting the equations can be discretized for efficient solution on a computer leading to valuable tools for simulation of natural and man-made processes. Numerical solution of PDE-based mathematical models has been an important research topic over centuries and will remain so for centuries to come. In the context of computer-based simulations the quality of the computed results is directly connected to the model's complexity and the number of data points used for the computations. Therefore computational scientists tend to, even the largest and most powerful computers they can get access to, either by increasing the size of the data sets or by introducing new model terms that make the simulations more realistic or a combination of both. Today many important simulation problems can not be solved by one single computer but calls for parallel computing.

Applied Data Science in Tourism Roman Egger, 2022-01-31

Access to large data sets has led to a paradigm shift in the tourism research landscape. Big data is enabling a new form of knowledge gain while at the same time shaking the epistemological foundations and requiring new methods and analysis approaches. It allows for interdisciplinary cooperation between computer sciences and social and economic sciences and complements the traditional research approaches. This book provides a broad basis for the practical application of data science approaches such as machine learning, text mining, social network analysis, and many more which are essential for interdisciplinary tourism research. Each method is presented in principle, viewed analytically, and its advantages and disadvantages are weighed up, and typical fields of application are presented. The correct methodical application is presented with a how-to approach together with code examples allowing a wider reader base including researchers, practitioners, and students entering the field. The book is a very well-structured introduction to data science, not only in tourism and its methodological foundations, accompanied by well-chosen practical cases. It underlines an important insight: data are only representations of reality; you need methodological skills and domain background to derive knowledge from them.

Hannes Werthner, Vienna University of Technology

Roman Egger has accomplished a difficult but necessary task: make clear how data science can practically support and foster travel and tourism research and applications. The book offers a well-taught collection of chapters giving a comprehensive and deep account of AI and data science for tourism.

Francesco Ricci, Free University of Bozen Bolzano

This

well structured and easy to read book provides a comprehensive overview of data science in tourism It contributes largely to the methodological repository beyond traditional methods Rob Law University of Macau
