Homeostasis

Homeostasis - **The maintenance of a constant internal environment in the body**

- The internal environment is the surroundings of cells like the blood and tissue fluid

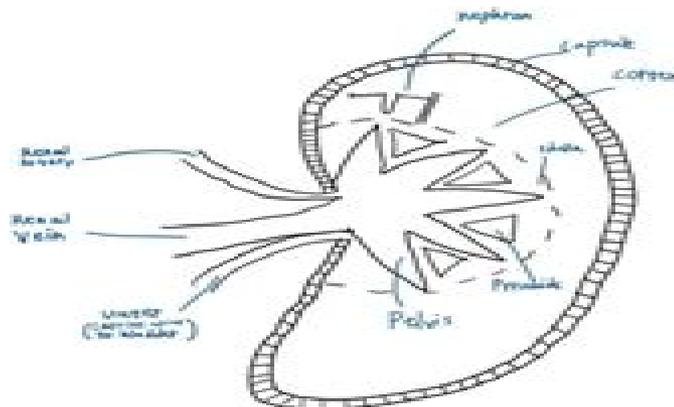

Factors controlled by homeostasis

1. Temperature: Provides the optimal temperature for enzymes (37°C)
2. Blood glucose: Provides energy and affects water potential
3. Water potential: Controlled by kidney (controls levels of water, urea, salt in blood) and controlling water potential to prevent crenation (cell shrinks) and cell lysis (cell expands)
4. pH: Provides the optimal pH for enzymes
5. Toxic waste: Needs to be kept low

**Tissue fluid surrounds all the cells of the body*

Kidney

Diagram of kidney

Role of the kidney

- Removes urea which is highly toxic (Urea comes from excess protein and formed in the liver)
- Adjust the water potential of the blood
