

**Check It Out! Example 2****Find the area of the triangle.**

Find  $b$ .  $b^2 + 12^2 = 20^2$

$$b^2 + 144 = 400$$

$$b^2 = 256$$

$$b = 16$$

$$A = \frac{1}{2}bh$$

*Area of a triangle*

$$A = \frac{1}{2}(16)(12)$$

*Substitute 16 for b and 12 for h.*

$$A = 96 \text{ m}^2$$

*Simplify.*

Martin Isaacs, 2009 One of the challenges many mathematics students face occurs after they complete their study of basic calculus and linear algebra and they start taking courses where they are expected to write proofs Historically students have been learning to think mathematically and to write proofs by studying Euclidean geometry In the author's opinion geometry is still the best way to make the transition from elementary to advanced mathematics The book begins with a thorough review of high school geometry then goes on to discuss special points associated with triangles circles and certain associated lines Ceva's theorem vector techniques of proof and compass and straightedge constructions There is also some emphasis on proving numerical formulas like the laws of sines cosines and tangents Stewart's theorem Ptolemy's theorem and the area formula of Heron An important difference of this book from the majority of modern college geometry texts is that it avoids axiomatics The students using this book have had very little experience with formal mathematics Instead the focus of the course and the book is on interesting theorems and on the techniques that can be used to prove them This makes the book suitable to second or third year mathematics majors and also to secondary mathematics education majors allowing the students to learn how to write proofs of mathematical results and at the end showing them what mathematics is really all about     **Teachers' Manual to Accompany Algebra for Today** William Betz, 1929     PLANE AND SPHERICAL TRIGONOMETRY WITH APPLICATIONS J.
