

Gene Expression—Translation

How do cells synthesize polypeptides and convert them to functional proteins?

Why?

The message in your DNA of who you are and how your body works is carried out by cells through gene expression. In most cases this means synthesizing a specific protein to do a specific job. First, mRNA is transcribed from the DNA code. Then, the mRNA sequence is translated into a polypeptide sequence.

Model 1 – Codons

- Model 1 defines the code scientists have discovered that relates the nucleotide sequence of mRNA to the amino acid sequence of polypeptides.
 - What do the letters U, C, A, and G in Model 1 represent?
mRNA nucleotides
 - What do the abbreviations such as Phe, Ile, Ala, and Gly in Model 1 represent?
amino acids
 - The language of mRNA is often described as a "triplet code." Explain the significance of this reference.
3 nucleotides are needed to code one amino acid

Quantitative Aspects of Growth and Metabolism of Microorganisms A.H. Stouthamer, 2012-12-06 Application of recent advances such as non equilibrium thermodynamics the maintenance concept and the material balancing method to the description of microbial growth has suggested new experimental approaches which have yielded a wealth of data These data have been used to develop mathematical models of microbial growth and metabolism and the models have made it possible to direct the metabolism of a microorganism in such a way that more of a certain desired product is made While a full quantitative description of all aspects of microbial growth and metabolism is still remote the new approaches are opening up large areas of new potential it is now possible for instance to deal with individual cells in a population and with quantitative aspects of product formation
