Time-Critical, Parallel, and Spatially Distributed Tasks Using Augmented Reality Jannike Illing,2025-05-15 Even in highly
automated production environments some tasks such as bonding and assembly still rely on human adaptability These tasks
are often time critical run in parallel and are spatially distributed across multiple workstations How can Augmented Reality
AR help reduce complexity and support workers in managing these demanding processes In this dissertation manual
manufacturing using bonding as a representative case is investigated and it is explored how AR can assist in the execution of
complex parallel and time critical tasks Following a Human Centered Design HCD approach the research is grounded in
observations and expert interviews leading to three central research questions How can time critical parallel tasks be
visualized within the field of view FoV How can they be guided outside the FoV How can users gain an overview of
distributed tasks Findings show that AR reduces task complexity improves performance and is preferred over traditional
instructions However supporting more than two concurrent tasks increases cognitive load For spatially distributed tasks
location based AR cues alone are not sufficient additional peripheral visual signals and spatially registered overviews are
