

Unit: Cellular Respiration Lab

Introduction:

Cellular respiration converts chemical energy from food into energy that can be used by the cell. This process is essential for all living organisms. The rate of cellular respiration can be measured by the amount of oxygen consumed or the amount of carbon dioxide produced. In this lab, you will use a respirometer to measure the rate of cellular respiration in germinating seeds. The respirometer consists of a chamber containing the seeds, a chamber containing a gas, and a chamber containing a liquid. The gas and liquid are connected by a tube. As the seeds respire, they consume oxygen and produce carbon dioxide. The carbon dioxide is absorbed by a substance in the liquid, causing the liquid to move. The distance the liquid moves is proportional to the amount of oxygen consumed.
