Computing the Sentence Anat Ninio,2025-12-18 Developmental research is abandoning formal syntax probably because Chomskyan generative syntax lacks psychological reality Some studies opt for pure statistics based definitions of syntactic knowledge as if humans were similar to Large Language Models of AI and had no structurally meaningful concepts of syntactic relations Others tend to Constructivist syntax where patterns of elements are said to possess associated semantic meaning The problem is that the core syntactic relations that young children acquire such as verb object and verb subject combinations do not possess particular associated semantics meaning that the Constructivist approach is not a helpful vehicle for understanding syntactic acquisition In this book Anat Ninio approaches syntactic development from a novel point of view within the framework of Relevance Theory a theory of pragmatics with a strong commitment to a cognitive conceptualization of linguistic competence This theory s architecture of linguistic information acknowledges the existence of procedural instructions as part of the content of words covering various processing acts including syntactic combination Methodologically the study employs computer programming algorithms as heuristic models for the cognitive combinatory processes of syntax computer programs being a close analogue to mental plans for solving computational problems The unusual framework and methodology adopted in the book represent a break with current approaches in developmental psycholinguistics and perhaps even with the teachings of mainstream linguistics The first part of the book proposes a procedural syntax of the central patterns of English covering argument structure constructions phrasal and clausal combinations of function words and content words wh questions relative clauses and coordination and gapping This modelling resolves significant issues that have been eluding linguistic theory for decades The second part of the book describes the development of certain syntactic procedures in English speaking children employing a microgenetic analysis to demonstrate that syntactic learning is guesswork by trial and error Despite the apparent chaos the many different attempts that children make to arrive at some syntactic construct belong to a single learning process and gradually converge on the adult algorithm Defining syntax in terms of combinatory procedures provides a novel perspective on our predictive brain on language structure and on cross linguistic variation
