

Heart Dissection Lab

Purpose of this lab:

To review the structural characteristics of the human heart and to examine the major features of a mammalian heart.

Procedure

- 1.** Obtain a preserved heart. Rinse it with water thoroughly to remove as much of the preservative/blood as possible. Also run water into the larger blood vessels to force any blood clots out of the heart chambers. You can even try to fill the heart with water and squeeze the ventricles and watch the water squirt out of the veins/arteries like it would during a contraction.

- 2.** Place the heart in a dissecting tray with its anterior surface up:
 - a. Locate the **pericardium**, which appears as a thin layer of tissue on the surface of the heart. Use a scalpel to remove a portion of this layer and expose the **myocardium** beneath. Also note the abundance of fat along the paths of various coronary arteries. This adipose tissue occurs in the loose connective tissue that underlies the pericardium.

 - b. Identify the following and show them to Mr. Tackmann.

<i>Right atrium</i>	<i>Right ventricle</i>	<i>Coronary arteries</i>
<i>Left atrium</i>	<i>Left ventricle</i>	<i>Aorta</i>
<i>Superior Vena Cava</i>	<i>Pulmonary Artery</i>	<i>Pulmonary Vein</i>
<i>Pulmonary Arteries</i>		

 - c. Take a picture of the heart (anterior view). You will need to label the above features later in this picture.

- 3.** Examine the posterior surface of the heart. Locate the stumps of superior and inferior vena cava that enter the right atrium. Demonstrate this connection by passing a slender probe through them (pencil/pen/finger).
