The Mathematical Structure of Stable Physical Systems Dr. Martin Concoyle, G.P. Coamundi, 2014-01-16 This book is an introduction to the simple math patterns used to describe fundamental stable spectral orbital physical systems represented as discrete hyperbolic shapes the containment set has many dimensions and these dimensions possess macroscopic geometric properties which are also discrete hyperbolic shapes Thus it is a description which transcends the idea of materialism ie it is higher dimensional and it can also be used to model a life form as a unified high dimension geometric construct which generates its own energy and which has a natural structure for memory where this construct is made in relation to the main property of the description being in fact the spectral properties of both material systems and of the metric spaces which contain the material systems where material is simply a lower dimension metric space and where both material components and metric spaces are in resonance with the containing space Partial differential equations are defined on the many metric spaces of this description but their main function is to act on either the usually unimportant free material components to most often cause non linear dynamics or to perturb the orbits of the quite often condensed material trapped by or within the stable orbits of a very stable hyperbolic metric space shape

Infrared Spectroscopy of Symmetric and Spherical Spindles for Space Observation 1 Pierre-Richard Dahoo, Azzedine Lakhlifi, 2021-05-25 This book is dedicated to the description and application of various different theoretical models to identify the near and mid infrared spectra of symmetric and spherical top molecules in their gaseous form Theoretical models based on the use of group theory are applied to rigid and non rigid molecules characterized by the phenomenon of tunneling and large amplitude motions The calculation of vibration rotation energy levels and the analysis of infrared transitions are applied to molecules of ammonia NH₃ and methane CH₄ The applications show how interactions at the molecular scale modify the near and mid infrared spectra of isolated molecules under the influence of the pressure of a nano cage the substitution site of a rare gas matrix clathrate fullerene or zeolite or a surface and allow us to identify the characteristics of the perturbing environment This book provides valuable support for teachers and researchers but is also intended for engineering students working research engineers and Masters and doctorate students
