- Pulmonary vessels (pulmonary arteries and veins)
- Aqueous bronchus (a)
- Lymph vessels
- Sympathetic and parasympathetic

The Pleura

- Double layer of serous membrane, cover the lungs (visceral) and inside the chest wall (parietal)
- A potential space between the two layers is filled with serous fluid and prevents friction when we breathe.

The Bronchioles

A diagram showing the bronchioles.

The bronchioles are small branches of the bronchi which link the alveoli in the lungs to the trachea. There are many bronchioles in the lungs. The bronchioles do not contain any blood vessels.

The Alveoli

Alveoli are small air sacs in the lungs which are specially adapted for gas exchange. The walls of the alveoli separating the air from the blood are very thin allowing gases to diffuse quickly. The blood supply to the alveoli is very good to constantly supply blood with little oxygen and a lot of carbon dioxide keeping a high concentration gradient. The walls of the alveoli are kept moist to allow gases to dissolve into the fluid for gas exchange with the blood.

A diagram showing several alveoli and the capillaries supplying them with blood.

A diagram showing a single alveolus with the oxygen going into the blood and carbon dioxide leaving the blood.
