Cell Membrane: This is the barrier that separates the cell from its environment. It is a phospholipid bilayer that is selectively permeable, meaning it allows some substances to pass through while blocking others.

Cytoskeleton: This is the internal structure of the cell that provides support and maintains its shape. It is made up of three main types of fibers: microtubules, intermediate filaments, and actin filaments.

Centrioles: These are two cylindrical structures that are located near the nucleus. They are made of microtubules and are involved in cell division.

Mitochondria: These are the powerhouses of the cell. They are responsible for producing energy in the form of ATP through a process called cellular respiration.

Rough Endoplasmic Reticulum: This is a network of membranes that is studded with ribosomes. It is involved in the synthesis and transport of proteins.

Smooth Endoplasmic Reticulum: This is a network of membranes that is not studded with ribosomes. It is involved in the synthesis and transport of lipids and the detoxification of drugs and poisons.

Lysosomes: These are small, spherical organelles that contain digestive enzymes. They are responsible for breaking down and recycling cellular waste.

Peroxisomes: These are small, spherical organelles that contain enzymes that are involved in the breakdown of fatty acids and the detoxification of drugs and poisons.

Vacuoles: These are large, fluid-filled sacs that are used for storage and transport of materials within the cell.
