

Straw Lab: Introduction to Equilibrium "What's Equal about Equilibrium?"

Materials

2 graduated cylinders, 2 drinking straws with different diameters, water, graph paper

Procedure

1. Label a graduated cylinder "A" and fill it to the mark with water. Label a second cylinder "B". Record the initial volumes of the two graduated cylinders.
2. Label one straw "A" and place it in the graduated cylinder "A". Label the other straw "B" and place it in the other graduated cylinder "B".
3. This step requires two people – one person for each straw. Lower the straws into your respective cylinders, and when each straw touches the bottom of the cylinder, place your index finger over the open end of the straw. Transfer the water collected to the other cylinder and allow the straw to drain.
4. Remove each straw and record the volume of water in each cylinder, being careful to read the meniscus to the nearest 0.1 mL.
5. Return the straws to their original cylinders and repeat the process, recording the volumes after each transfer.
6. After three successive transfers result in no change in volume, add 1 mL of water to cylinder "A". Record the volumes in each cylinder, then resume the water transfer until three successive readings are again identical.

Data Table

Number of transfers	Volume of water in cylinder "A" (mL)	Volume of water in cylinder "B" (mL)	Number of transfers	Volume of water in cylinder "A" (mL)	Volume of water in cylinder "B" (mL)

Calculations

Plot the volume of water for both "A" and "B" on the y-axis of the same piece of graph paper against number of transfers on the x-axis. Join each set of points with a smooth curve.

to provide a practical introduction to aqueous equilibrium phenomena for both students and research workers in chemistry
biochemistry geochemistry and interdisciplinary environmental fields The pedagogical strategy I have adopted makes heavy
use of detailed examples of problem solving from real cases arising both in laboratory research and in the study of systems
occurring in nature The procedure starts with mathematically complete equations that will provide valid solutions of
equilibrium problems instead of the traditional approach through approximate concentrations and idealized infinite dilution
assumptions There is repeated emphasis on the use of corrected conditional equilibrium constants and on the checking of
numerical results by substitution in complete equations and or against graphs of species distributions Graphical methods of
calculation and display are used extensively because of their value in clarifying equilibria and in leading one quickly to valid
numerical approximations The coverage of solution equilibrium phenomena is not however exhaustively comprehensive
Rather I have chosen to offer fundamental and rigorous examinations of homogeneous step equilibria and their interactions
with solubility and redox equilibria Many examples are worked out in detail to demonstrate the use of equilibrium
calculations and diagrams in various fields of investigation
