## Endocrine System: WORKING TOGETHER

## Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly with chemical messengers called hormones.

### Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. In this condition, blood sugar gets too high or too low. Symptoms include blurry vision, hunger, thirst, weight loss, frequent urination, and fatigue in the body.

## Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information. Chemical messengers that carry information.

## Endocrine System: FACTS

## Endocrine System: FUNCTIONS

The endocrine system is a network of glands that produce hormones. Hormones are the body's chemical messengers that carry information and instructions from one set of cells to another. Hormones control many, many important processes in our bodies.

### Function of the Endocrine System

## Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released by endocrine glands into the bloodstream. They travel through the bloodstream to target cells, where they bind to receptors and cause a response. This response can be anything from increasing the rate of metabolism to triggering the release of other hormones.

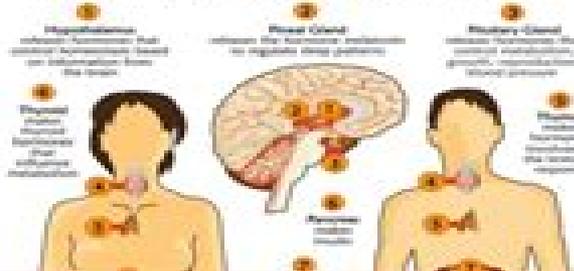

## Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when you are really frightened. The brain (hypothalamus) recognizes the situation and sends signals to the adrenal glands. The adrenal glands release hormones that prepare the body to either fight or flee. These hormones increase heart rate, blood pressure, and energy levels. In addition, the body's response to stress can be harmful to the body.

## Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a variety of functions in the body. There are many different types of glands, each with its own unique function. Some glands are part of the endocrine system, while others are not. The glands below show the location and the major function of endocrine glands.

## Endocrine System: FEEDBACK LOOPS

Feedback loops are a way for the body to maintain balance. They are a series of steps that allow the body to respond to changes in its environment. There are two types of feedback loops: negative and positive. Negative feedback loops are the most common. They work by reducing the amount of a hormone when it is too high. Positive feedback loops are less common. They work by increasing the amount of a hormone when it is too low.
