

# ENERGY FLOW IN ECOSYSTEMS

## Energy Flow

Read the passage carefully before answer.

Producers rely on the flow of energy to sustain themselves in the food web, which provides the energy and other products. When producers are not available, this energy then passes through the food web to the animals and plants, which use it for their own survival. The flow of energy in an ecosystem is unidirectional, meaning that it flows in one direction only.

Photosynthesis is the process by which autotrophic plants, algae, and some bacteria use light energy to produce glucose and oxygen. This process requires carbon dioxide and water. The glucose produced is used for energy and growth, while the oxygen is released into the atmosphere. The energy from photosynthesis is transferred to other organisms in the food web.

Consumers use plants and animals for energy. They eat plants and animals to obtain energy. The energy from the food they eat is used for growth, reproduction, and other life processes. The energy from the food is transferred to the consumer's body, where it is used for these purposes. The energy from the food is also used to produce heat, which is lost to the environment.
